Non-repudiation: The inability to deny. In cryptography, it is a security service by which evidence is maintained so that the sender and the recipient of data cannot deny having participated in the communication. There are two flavors of non-repudiation, “nonrepudiation of origin” means the sender cannot deny having sent a particular message, and “nonrepudiation of delivery’” where the receiver cannot say that they have received a different message than the one that they actually did receive.

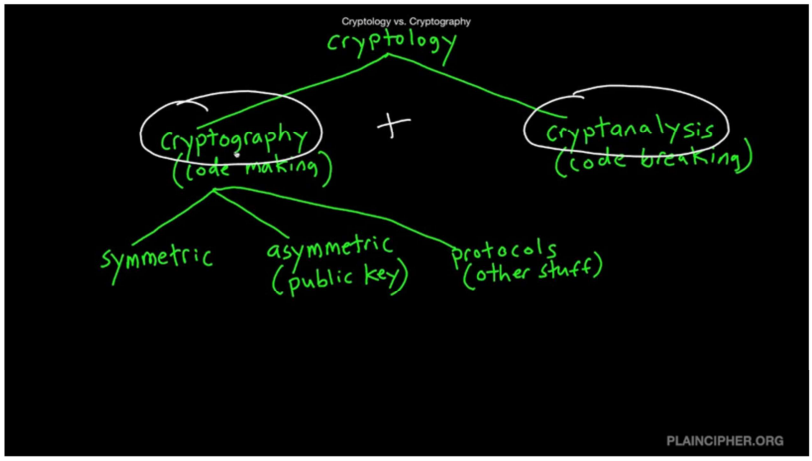

Cryptanalysis

© 2018 Al-Nafi. All Rights Reserved.

Cryptanalysis: The study of techniques for attempting to defeat cryptographic techniques and, more generally, information security services.

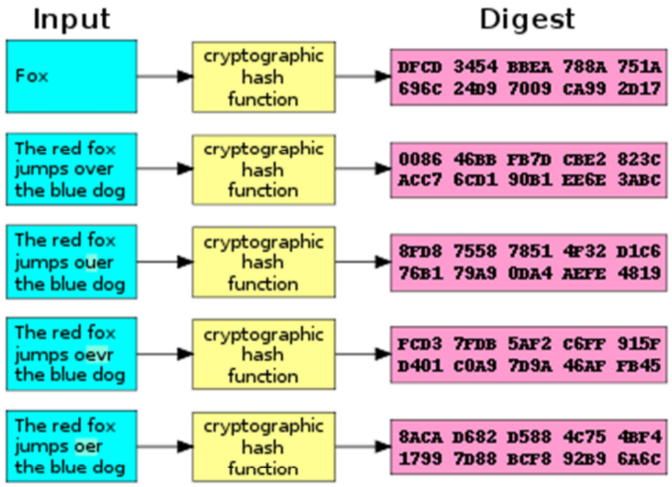

Cryptology

© 2018 Al-Nafi. All Rights Reserved.

Cryptology: The science that deals with hidden, disguised, or encrypted communications. It embraces communications security and communications intelligence.

Hash in Crypto

© 2018 Al-Nafi. All Rights Reserved.

Hash function: A hash function is a one-way mathematical operation that reduces a message or data file into a smaller
fixed length output, or hash value. By comparing the hash value computed by the sender with the hash value computed by the receiver over the original file, unauthorized changes to the file can be detected, assuming they both used the same hash function. Ideally, there should never be more than one unique hash for a given input and one hash exclusively for a given input.
